

## Bare Root Prices

# Fruit Trees

January 2024 9-16'-2023

Most of our bare root fruit trees arrive in early January with ornamental and specialty fruit trees (espaliers) arriving by February. This list represents plants that our supplier has confirmed, however these plants are a crop subject to weather and other factors. You can buy these in January from our display at the rear area of our store.

You may also reserve any item listed before our shipment arrives by purchasing it now (provided we have been allotted sufficient quantity). We reserve trees according to the time and date the order was placed. The reserved trees will be set aside as they arrive and packaged and stored properly. The customer will be contacted. An entire order may not arrive at the same time. Note that bare root plants are a perishable product and should be picked up within a week of being contacted.

## Apple

__ Anna on M111 rootstock	\$49
__ Arkansas Black Spur on M111 rootstock	\$49
__ Ashmead's Kernel on M111	\$54
__ Dorsett Golden on M111 rootstock	\$49

__Splash on Myro 29C rootstock	\$52

## Nuts

__Almond Garden Prince on Nemaguard rootstock	\$54
__Walnut Placentia on N. Calif. Black rootstock	\$79

## PRODUCT NOTES

The typical packaged bare root tree is about 5' tall with a trunk caliper of 5/8" and about 10 pounds in weight and can be carried home on its side (laying down). A few items are much larger or smaller.

Ideally these plants should be installed immediately. If not, store them outdoors in a mostly shaded location (the plastic bag covering the roots should not be exposed to the sun). Indoors is normally too warm and will cause the plants to wake up too soon. Do not expose the bag to freezing temperatures. Note that bare root plants are a perishable product and cannot be stored for more than a few weeks.

## WARNING

Most bare root failures are due to unsupervised installation by professional gardeners. We have a "planting guide" available with specific instructions for bare root trees. Nearly any potting soil or planter mix available at other garden centers will cause failure and death of these bare root plants.

## REPLANT SYNDROME

Be aware that plants will not grow well in the same soil twice. Trees installed near an existing related tree or in the location where a relative died or was removed will show very poor growth.

## GENERAL PLANTING TIPS

The roots have to be kept fairly cool and moist or wet at all times. Failure to grow is usually due to damage to the roots so they cannot provide enough water to the top of the tree to keep it properly hydrated. Trunks and branches are not totally water proof and dry winter winds can cause them to dehydrate. A tall bare root tree will lose water much faster than a short one. Don't be afraid to prune. A short healthy tree will grow back quickly. A tall dead tree won't grow at all. Nearly all bare root tree failures were not pruned. We can prune the trees for you if asked.

When planting in the ground do not use amendments like manure, sawdust, wood chips, bark, leaves or kitchen scraps. Compost of any kind will kill roots. Sand, pumice, perlite, charcoal and peat moss are acceptable.

All that is required is a shovel. There are few situations where a soil other than the native soil would be recommended. Fertilizers can be applied after installation but are not essential for health or survival.

When planting in containers use our TOP POT soil. Most other potting soils will kill the tree. "Washed Sand" & "All Purpose Sand" are also excellent soils in containers. Apply fertilizer within a month of installation.

Be aware that success varies with the type of tree. We rarely lose any stonefruit tree (apricot, nectarine, peach, plum, etc.), apples or pears. Heavier losses are seen with persimmon, jujube, and walnut.

## Guarantee

Our bare root trees are guaranteed for 6 months to begin growth and be true to type or you will receive a refund. To be eligible for a refund you must return the tree and have a receipt or have your name and phone # in our store register.
